

The First Native Money Market on Polkadot Hub.

Deposit vDOT or native DOT. Borrow USDH. Built for PolkaVM with Zero-Knowledge solvency reporting.

```
> protocol.init()  
> 12_contracts_deployed [OK]  
> 98_tests_passing [OK]  
> zksolvency_active [OK]
```

\$200M in Yield-Bearing vDOT is Sitting Idle.

Bifrost Liquid Staking

\$200M+

vDOT TVL

~15%

Staking Yield

76%

Hydration Utilisation
(Supply Cap Hit)

Hydration USDH

\$330M

Stablecoin TVL

Users holding vDOT need liquidity. Users holding USDH need yield.
Zero native lending markets exist on Polkadot Hub to connect them.

Deposit vDOT. Borrow USDH. Keep the Yield.

Borrowers maintain a deeply positive carry.
You never have to sell your staked DOT to access stablecoin liquidity.

The Missing Primitive in the Polkadot DeFi Stack.

Feature	Aave (Ethereum)	Hydration (Polkadot)	DotLend (Hub)
Native Polkadot Assets	Wrapped Only 	Native	Native (vDOT, WPAS) 
Collateralised Lending	Yes	AMM Only 	Yes (70% LTV) 
Staking Yield Passthrough	Yes (stETH)	N/A 	Yes (~15% vDOT) 
Value Accrual Flywheel	Weak (Burn) 	LPs	Strong (Treasury buys DOT) 
ZK Solvency Proofs	No 	No 	Yes (Noir / UltraHonk) 

Hydration is an AMM. DotLend is a collateralised debt engine. We are the liquidity source for the broader ecosystem.

Engineered Natively for PolkaVM Constraints.

Forbidden EVM Patterns		DotLend Engineering Solution
⚠ SELFDESTRUCT	→	✓ No <code>selfdestruct()</code>
⚠ CREATE2 / Factories	→	✓ Direct contract deployment
⚠ EXTCODECOPY	→	✓ Pure state machine
⚠ assembly {}	→	✓ Pure Solidity
⚠ Floatig Point / ABDKMath	→	✓ 1e18 integer basis
⚠ OpenZeppelin v5.x	→	✓ Pinned strictly to OZ v4.9.6
Compiler: resolc 0.5.0 via @parity/hardhat-polkadot Artifact format: hh-resolc-artifact-1 Bytecode prefix: 0x50564d00		This isn't an Ethereum protocol transplanted to Polkadot. Every line of code was designed explicitly around the PolkaVM execution environment.

Overcoming the 100KB Initcode Wall.

By extracting the Zero-Knowledge infrastructure into an independent gateway, both contracts easily bypass the PolkaVM deployment limit while maintaining shared security.

Deep OpenZeppelin Composition Under 24KB Constraints.

The Problem

The Solution

Synthesis: Forcing fee logic into an external router didn't just solve a compiler limit—it created a more auditable, upgradeable, MakerDAO-style fee capture mechanism.

A Trustless, Lazy-Accrual Liquidation Engine

Interest accrues via a lazy block.timestamp model—saving gas by only computing on user interaction. A 10% gap between LTV and liquidation absorbs market volatility.

The First ZK-Proven Money Market on Asset Hub.

We don't rely on trust. Every 30 minutes, DotLend cryptographically proves it is fully solvent without revealing a single user's private collateral position.

Transparent Cryptography and the PolkaVM Roadmap.

The UltraHonk verifier requires assembly blocks for pairing checks.

PolkaVM does not yet support BN254 precompiles.

Our circuit is production-ready today; the moment Polkadot ships precompile support, we swap the mock verifier for full trustless verification.

Trustless Price Discovery via Hyperbridge ISMP

Snowbridge Transforms the Testnet into a Two-Sided Market.

Snowbridge is live with zero on-chain downtime. DotLend V2 replaces testnet proxies with real bridged assets, creating the ultimate Aave-style liquidity layer for the entire Polkadot ecosystem.

Every Dollar Borrowed Becomes Market Demand for DOT.

We do not burn stablecoins. Burning destroys borrowing capacity for zero value. Following the MakerDAO model, DotLend uses 100% of real asset revenue to buy, stake, and distribute native DOT.

Shipped by a Solo Engineer in One Hackathon Window.

The Math

12 Smart Contracts Deployed

92 Hardhat Tests (0 Fails)

6 Forge Fuzz Tests

2 Live Collateral Markets

The Ask & Next Steps

- 1.** Win Polkadot Solidity Hackathon.
- 2.** Secure Web3 Foundation Grant for PAL Security Audit.
- 3.** Bootstrap \$1M TVL with early vDOT depositors.
