

DotLend

The First Money Market on Polkadot Hub.

Deposit vDOT. Borrow USDH. Prove Solvency via ZK.

\$200M+ Sitting Idle. Zero Ways to Borrow.

I was earning 15% APY on vDOT but needed liquidity. Selling meant losing yield.

Ethereum has Aave (\$20B TVL) to solve this in 30 seconds. Polkadot Hub had exactly zero lending markets.

Ethereum

Polkadot Hub

The assets are here. The two-sided market connecting them is missing. So I built it.

Immediate Liquidity. Zero Yield Sacrifice.

LTV: 70% | Liquidation Threshold: 80% | Stability Fee: 0.5%/yr | Treasury Fee: 100%

Built for Polkadot's Native Composability

The EVM Fork Failure Path

The DotLend Native Advantage

Cryptographically Proven Solvency. Every 30 Minutes.

Every lending protocol says “trust us.” We say “verify.”

Builder's Disclosure: On-chain verification uses MockSolvencyVerifier on testnet today. The full UltraHonk verifier is coded in the repo, awaiting PolkaVM BN254 (EIP-196/197) precompile support to deploy natively.

Shipped. Tested. Live on Testnet.

12

Contracts Deployed (across vDOT and WPAS native DOT markets).

98

Tests Passing (92 Hardhat & 6 Forge fuzz tests. 0 failures).

• Oracle Live

Posting vDOT/DOT prices every 30 minutes.

• Solvency Live

ZK proof generated and verified every 30 minutes.

[Deposit]

[Borrow]

[Repay]

[Liquidate]

Full crisis simulation and lifecycle tested and active at nexucore.xyz.

Engineering Under Constraints.

A forced constraint resulted in a cleaner architecture. The separation makes the protocol significantly more testable, upgradeable, and auditable.

The Constraint

The Elegant Solution

Fixing What Incumbents Cannot.

Features	DotLend	Ethereum Incumbents (Aave)
Asset Support	✓ Native vDOT / USDH	✗ Wrapped Assets Only
Staking Yield Passthrough	✓ Base Interest + 15% Staking Yield	✗ None
Value Accrual	✓ Real DOT Treasury Backing	✗ Weak Governance Token Utility
Liquidation Engine	✓ ZK-proven XCM Alerts	✗ Chaotic MEV Bot Front-running

Historical Context: Parallel Finance failed with \$29M TVL before Hub EVM existed. DotLend is deploying at the exact right time, on native infrastructure.

100% of Fees Do Real Work. Zero Pointless Burning.

USDH is a stablecoin; burning it destroys borrowing capacity.

DotLend follows the proven MakerDAO model to generate real backing.

Snowbridge Unlocks the Two-Sided Market.

The Catalyst: Snowbridge (\$75M+ TVL, zero downtime) brings wETH, wBTC, and USDC to Polkadot Hub natively.

Diverse Collateral

Deep Borrowing Liquidity

V2 evolves DotLend into a full-scale Aave competitor, matching diverse collaterals with massive blue-chip liquidity pools.

Proven TAM. Profitable at 5% Penetration.

Revenue Projections (Based on 0.5% Protocol Fee)

\$10M TVL	\$50,000 / year	Status: Self-Sustaining
\$40M TVL	\$200,000 / year	Status: Highly Profitable
\$100M TVL	\$500,000 / year	Status: Tier 1 DeFi Status

From Hackathon to Ecosystem Primitive.

The Catalyst Required to Scale.

The Architect Profile

Arhant Barmate (Orthonode)

Solo Founder & Full Stack Engineer

Built every contract, test, frontend, ZK pipeline, and this presentation during the hackathon. Unsalaries until self-sustaining.

JetBrains Mono

The Ask Checklist

1

Win this Hackathon

Validation + runway to continue building.

2

W3F Grant

Fund the mainnet PAL security audit.

3

Early Depositors

Bootstrap the first \$1M TVL.

The primitive is missing. The foundation is built. Let's connect them.
